

Why do your geospatial work in R?

Free and open-source

Reproducible record of your code (as opposed to point-and-click)

Good documentation and community support

Can run locally on any operating system or on the VACC

Flexible, and you're probably already using it for other things

with a couple caveats and exceptions...

Vector data

Polygons

Points

Lines

Primary and secondary roads

Raster data

Elevation (m)

CRS and map projections

Geoid

Ellipsoid

Datum

Latitude and
longitude

CRS and map projections

CRS and map projections

Mercator

Cylindrical Equal Area

Albers Equal Area Conic

Do you want to preserve distance? area? direction? shape?

Some of the things you can do

Point patterns

Random

Clustered

Uniform

Effective migration surfaces

Spatial interpolation

Zonal statistics
